

PROJECT OVERVIEW

College Timetable

A weekly class planner, built by vibe coding with Claude

Set your class, add subjects and time slots, then click any cell to schedule a class. It runs in the browser, saves automatically, and prints a clean one-page timetable.

The app with sample data for CSE K: subjects and time slots on the left, the weekly grid on the right.

What it does

College Timetable replaces a hand-drawn or spreadsheet timetable with a focused tool for one class. You describe the week once — which subjects you study, who teaches them and when the periods run — and the app lays it out as a Monday-to-Saturday grid you can read at a glance, edit in seconds and print.

Your class

- Asked once on first visit (for example *CSE K*)
- Shown under the title and printed at the top of the page
- Change it any time with the pencil next to it

Time slots

- Periods and breaks such as Short break and Lunch
- The next slot is pre-filled, so a full day takes a minute
- Overlapping slots are rejected; slots are editable too

Printing

- Switches to a clean white page with the class name on top
- Full subject names — nothing cut off — with a colour bar per class
- A six-period week fits on a single sheet

Subjects

- Subject name, subject code and staff name
- Each gets its own colour from a set of nine distinct hues
- Edit or delete later; classes already placed stay put

Weekly grid

- Monday to Saturday, rows in time order
- Click a cell to add, change or remove a class
- Each class shows subject name, code and staff name; today's column is highlighted

Everyday use

- Saves automatically in the browser; no account needed
- Works on phones as well as laptops
- Load sample data to try it; Reset all to start fresh

On a phone the sidebar and grid stack; the grid scrolls sideways.

How it works

The whole app is four small files served as a static website. There is no server code and no database: the browser does everything, which keeps it fast, free to host and easy to understand.

FILE	ROLE
<code>index.html</code>	Page structure: header with the class line, sidebar tabs and forms, the timetable, and the class and cell dialogs
<code>css/style.css</code>	Charcoal theme built on a handful of colour tokens, responsive layout for phones, and a separate print style
<code>js/storage.js</code>	The only code that touches browser storage: loads, saves and checks for a first visit
<code>js/app.js</code>	Forms, validation, editing, rendering the grid, dialogs, sample data
<code>college-timetable-single.html</code>	The same app with CSS and JavaScript inlined into one file, handy for sharing offline

The data

Everything the app knows fits in one small object. Each class on the grid is stored by its day and time slot and simply points at a subject, which is why renaming a subject instantly updates every cell it appears in.

```
{
  className: "CSE K",
  subjects: [ { id, name, code, faculty, color } ],
  slots:    [ { id, start: "08:00", end: "08:40", label, isBreak } ],
  entries:  { "mon|<slotId>": { subjectId } } // one class per day and slot
}
```

Saving

After every change the app writes that object to the browser's *localStorage*, a small private store each website gets on your device. Reopening the site in the same browser brings the timetable straight back.

What that means: your timetable never leaves your device. Someone opening the same link sees their own empty timetable, not yours. A different browser or phone starts empty, and clearing browser data — or pressing Reset all — removes it.

Checks that keep the data sensible

- Time slots must end after they start and may not overlap another slot (a slot being edited is never compared with itself).
- Subject names must be unique; deleting a subject that is in use asks first and removes its classes.
- Everything typed in is escaped before it is shown, so names can't break the page.

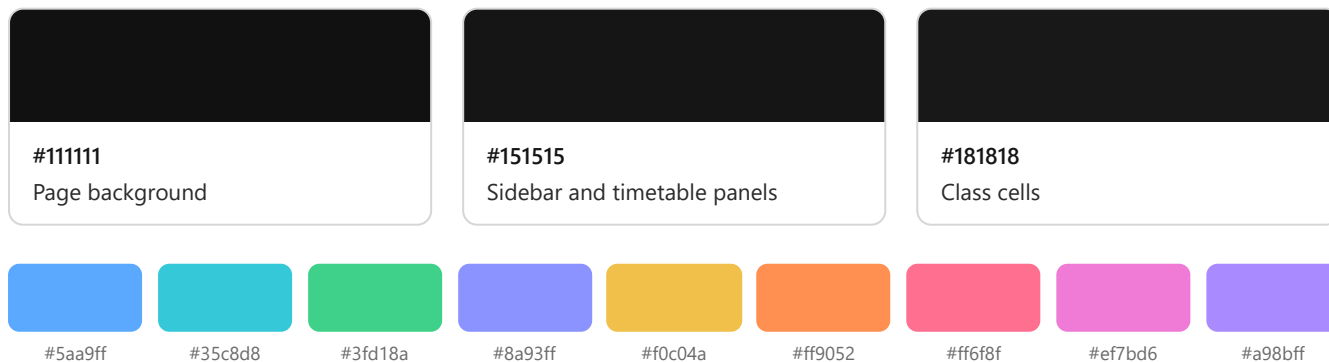

How it was built

The project was vibe coded: I described what I wanted, looked at each result and gave feedback, and Claude — working in Claude Code — wrote, tested and deployed all of the code. Claude checked its own work along the way, opening the app in a browser, printing it to PDF and measuring the layout before each change went live.

- 01 **First version.** A simple, responsive college timetable app in HTML, CSS and JavaScript, with the project structure explained before any code.
- 02 **Black, minimal UI.** The interface moved to a dark, simple and aesthetic look.
- 03 **Colour decisions.** An all-monochrome version was tried, then set aside for the soft-colour style.
- 04 **Testing and bug fixes.** Browser testing caught an edit dialog that closed by accident and an Escape key that didn't close it.
- 05 **Published.** Deployed on Vercel and pushed to GitHub, with Vercel redeploying on every push.
- 06 **Analytics.** Vercel Web Analytics added to count visitors.
- 07 **Reshaped around one class.** Rooms removed in favour of a single class name; subjects and time slots made editable; a clearer set of nine subject colours.
- 08 **Better printouts.** Full subject names, colour bars aligned to each row, and the week on one page.
- 09 **Charcoal theme.** The final three-step palette of #111111, #151515 and #181818.

Colour and layout

The screen uses three close charcoal tones as layers — page, panels, and the class cells inside them — with thin borders doing the separating. Subject colours are the only bright elements, so the eye goes straight to the timetable.

The nine subject colours, handed out in order so neighbouring subjects never look alike. Any subject's colour can be changed by hand.

Deployment

The code lives in a public GitHub repository. Vercel is connected to it, so publishing a change is a single step: push to the main branch and the live site updates within about a minute.

PIECE

DETAIL

Repository	github.com/vjxeyy/college-timetable (public)
Live site	college-timetable-vjxeyy.vercel.app
Hosting	Vercel, static site, production deploys from <code>main</code>
Analytics	Vercel Web Analytics — counts page views without cookies

Limitations and next ideas

Current limitations

- The timetable lives in one browser; it doesn't sync between devices.
- There is no way yet to share your exact timetable with classmates.
- One class per browser.

Ideas for next versions

- Export and import a timetable file to move it between devices.
- A share link that opens someone else's timetable read-only.
- A link preview image so the site looks good when shared.

Built by vibe coding with Claude. I described what I wanted in plain English, and Claude, working in Claude Code, wrote every line of the HTML, CSS and JavaScript. No code in this project was written by hand.
